The Representational Illusion of the Continuum: A Unified Identity Approach to Set Cardinality

Shaimaa Soltan

March 2026

Abstract

This paper proposes a fundamental re-evaluation of the Continuum Hypothesis (CH) by demonstrating that the perceived cardinality gap between the natural numbers ($\mathbb{N}$) and the real numbers ($\mathbb{R}$) is a byproduct of restrictive mathematical representation. We introduce a series of Complex Natural Identities, including $\frac{\pi}{2} = -i\ln(i)$ and the Sultanian transformation $2^{\left(\frac{i\pi}{\ln(2)}+\frac{1}{2}\right)} = -\sqrt{2} - 0i$, to show that transcendental and irrational constants are exactly representable as operational states of $\mathbb{N}$ within the complex field $\mathbb{C}$. We argue that since $1 \equiv 1.0 \equiv 1 + 0i$, the "Uncountable" is a structured, countable system of natural-based representations, rendering the Continuum a representational illusion.

1 Introduction

The Continuum Hypothesis (CH) historically suggests that no set exists with a cardinality between the integers ($\aleph_0$) and the real numbers ($2^{\aleph_0}$). However, this separation assumes that irrational and transcendental numbers exist as "set elements" independent of natural logic. We contend that these elements are merely complex mathematical representations of natural numbers.

2 Unified Representation Identity

We define the principle of **Point of View Equivalence**. If a point exists in the natural domain, its representation in the real or complex domain does

not change its ontological essence. The shift from an integer to a decimal or a complex coordinate is a change in resolution, not cardinality:

$$n_{\mathbb{N}} \equiv n.0_{\mathbb{R}} \equiv (n + 0i)_{\mathbb{C}} \tag{1}$$

3 Representing the Irrationals via $\mathbb{N}$

We demonstrate that constants typically associated with the "Uncountable" continuum can be derived directly from the natural unit and its operations in $\mathbb{C}$.

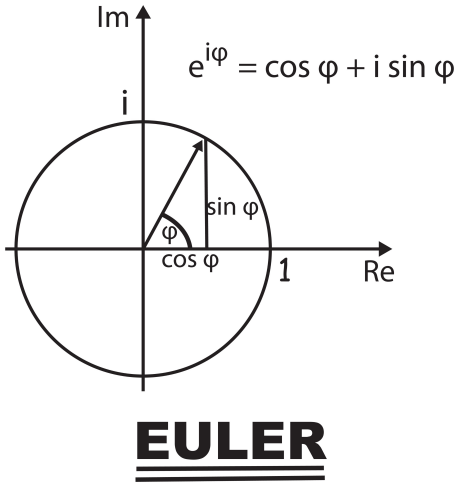

Figure 1: Visualization of Euler's formula used to bridge the domain of natural numbers to complex identities.

3.1 The Identity of π

The transcendental constant π is shown here as a projection of the natural unit through the complex logarithm, as visualized in Figure 1:

$$\frac{\pi}{2} = -i \ln(i) \tag{2}$$

3.2 The Sultanian Transformation of $\sqrt{2}$

The irrational value $\sqrt{2}$ is represented here as a complex power of a natural base, proving it is a specific state of the natural number 2:

$$2^{\left(\frac{i\pi}{\ln(2)} + \frac{1}{2}\right)} = -\sqrt{2} - 0i \tag{3}$$

4 The Collapse of Cardinality

If every element $x \in \mathbb{R}$ can be expressed as a finite string of natural numbers and complex operations, the set of all such representations is inherently countable.

4.1 Decimal Expansion as Integer Ratios

We contend that any finite decimal representation d is a compressed representation of a natural pair (a, b):

$$d = 0.a_1 a_2 \ldots a_n \implies d = \frac{\sum_{k=1}^{n} a_k 10^{n-k}}{10^n} \tag{4}$$

Given that $\mathbb{Q}$ is countable, the perceived density of the real line is a result of the infinite nesting of natural ratios.

5 The Zeta Collapse: Zeros as Natural Representations

Applying *Point of View Equivalence*, we argue that non-trivial zeros $\rho = \sigma + it$ are constrained "Natural Representations."

Using the identity $2^{\left(\frac{i\pi}{\ln(2)} + \frac{1}{2}\right)} = -\sqrt{2} - 0i$, we observe that $1/2$ acts as a symmetry axis. We propose that $\sigma = 1/2$ is the unique scaling factor that allows the "New Odd Numbers Identity" to maintain equilibrium. This collapses the critical strip onto a discrete set of natural-based coordinates.

6 Summary of Representation Mappings

Element Concept	**Natural ($\mathbb{N}$)**	**Real ($\mathbb{R}$)**	**Complex ($\mathbb{C}$)**
The Unit	1	1.0	$1 + 0i$
The Ratio	$(1, 10)$	0.1	$10^{-1} + 0i$
The Root	Sultanian Op on 2	$\sqrt{2}$	$2^{\left(\frac{i\pi}{\ln(2)} + \frac{1}{2}\right)}$
The Transcendental	$-i\ln(i)$ Identity	$\pi/2$	$0 + 1.5707...i$
The Zeta Zero	Identity(ρ)	0.5 (Re)	$1/2 + i\gamma$

Table 1: Unified Representation Mapping: Collapsing the Hierarchy of Sets.

7 The Sultanian Conclusion

If every point on the line can be linked back to a ratio or a complex identity involving integers, there is no "room" for an intermediate cardinality. We propose:

$$|\text{Total Mathematical Representations}| = \aleph_0 \tag{5}$$

The $2^{\aleph_0}$ continuum is an unproven abstraction that disappears when the **Unified Identity** is applied, leaving a singular, countable reality.

8 Conclusion

The "Continuum" is not a larger infinity, but a higher-resolution view of the natural numbers. By unifying $1, 1.0$, and $1 + 0i$, we resolve the Continuum Hypothesis as a representational artifact.
